

DAMARA BIO-AGRI PRESENTS OUR

"CROP ROTATION IN A BOX"

HUMISURE™

HUMISURE is a multi-functional solution

Consisting of **beneficial microbes** and **organic catalysts**, Humisure works to increase soil health by promoting microbial diversity, as would a good crop rotation, ultimately increasing soil health. **Beyond this, Humisure has multiple other functions as seen below:**

1 Stover Breakdown

Your crop residue is **FREE FERTILIZER**

▼

Humisure speeds up the breakdown of **Organic Material >>> Humus**

▼

Releasing nutrients (NPK) from stover

▼

NPK becomes available on demand to the next crop (unlocking the NPK piggybank)

2 Crop Rotations

Help reduce pressure from **TIGHT CROP ROTATIONS**

▼

The various functional groups in Humisure increase microbial diversity

▼

Diversity of soil microbes = Quorum Sensing = monopoly over the pathogenic "bad" microbes

▼

Reduces soil-borne disease pressure in conventionally farmed soils

3 Soil Enhancement

As an addition to your current program, Humisure works to **RESTORE SOIL FERTILITY**

▼

Supplying the right functional groups in high concentrations

- Breaks down carry-over chemicals
- Releases locked-up micro-nutrients
- Enhances applied fertilizer efficiency
- Increases soil & plant health
- Increases resistance to pest & disease
